MVP — USER FLOWS, PROCESS FLOW & SCREENS

Simplified proposal to test the model with low efforts and investments

Executive summary

TerraFerra is a drop-based fashion commerce layer. An independent designer launches a small, limited run — say 50 pieces of a new design — and sells it directly to consumers through influencer-driven discovery and virtual try-on.

For the MVP the platform is intentionally lean: a single web page per drop, with no native app and no inventory or production risk taken on by TerraFerra. The designer joins for a fixed fee and handles their own logistics. Influencers are sourced manually or through Insense, promote the drop via a tracked affiliate link, and earn commission on sales.

Consumers reach the drop page, try the piece on themselves via a third-party virtual try-on API, optionally share their look to their own social — which is automatically published to the TerraFerra gallery and added to the designer's portfolio — and then buy. A deliberately simple return-initiation step routes any return straight to the designer.

The build surface is therefore narrow: the drop page, the try-on and share/portfolio pipeline, checkout with affiliate attribution, and a minimal returns request. Everything else is borrowed from established third parties.

Web page per drop

no native app yet

No inventory risk

designer holds & ships stock

Fixed fee + affiliate

designer pays to join; influencer earns per sale

Try-on, share, buy

one mobile flow, third-party VTO

Scope — what we build vs what we borrow

TerraFerra BUILDS

- **Drop web page** — templated, one per drop, mobile-first
- **Virtual try-on integration** — calls the VTO API, handles upload & render
- **Share + UGC pipeline** — look to TF gallery + designer portfolio
- **Checkout + affiliate attribution** — captures order, credits the influencer
- **Returns request** — one simple form, routed to the designer
- **Designer onboarding + join fee** — sign-up and fixed-fee payment

TerraFerra BORROWS (3rd parties)

- **Insense** — influencer sourcing, affiliate links, creator payouts
- **Virtual try-on API** — e.g. FASHN / Amazon Nova for rendering (more VTO here <https://trendsonfire.com/technology/fashion-sizing-tech.html>)
- **Payment provider** — e.g. Stripe for checkout & money movement
- **Social platforms** — Instagram / TikTok for the share itself
- **Designer logistics** — production, shipping & refunds (designer's own)

Actors & third parties

Third-party services (borrowed, not built)

End-to-end process flow

Tags below each step show the mechanism. TerraFerra never holds inventory or runs production — the designer does.

Step by step — in words

1. Designer joins (can be hardcoded for the first tests)

Signs up to TerraFerra and pays a fixed join fee. Uploads the design (product + garment images), sets the price and the run size (e.g. 50).

2. Drop page goes live (can be hardcoded for the first tests)

TerraFerra generates one mobile web page for the drop — no app. It carries the product, the try-on, the share and the buy button.

3. Influencer is sourced (can be multiple for test or as permanent)

Found manually or through Insense. The influencer agrees terms and receives a tracked affiliate link for this drop.

4. Influencer promotes

Posts to their audience on Instagram / TikTok with the affiliate link, sending consumers to the drop page (attribution recorded on arrival).

5. Consumer tries it on

On the drop page the consumer uploads a photo; a third-party VTO API renders them wearing the piece.

6. Consumer shares the look (optional voting the look option to enhance more gamification)

One tap shares the look to their social. The look is automatically added to the TerraFerra gallery and the designer's portfolio.

7. Consumer buys

Checkout via the payment provider. The affiliate link credits the influencer's commission on the sale. In the beginning returns deduction will be done manually. in the future pay outs can be done only after return period expired.

8. Designer ships

The designer fulfils and ships using their own logistics. TerraFerra holds no stock.

9. Returns (if needed)

The consumer starts a return with one simple form. It routes straight to the designer, who handles the refund or exchange.

Consumer user flow

- Arrives from the influencer's post; affiliate attribution is captured the moment the page loads.
- Tries the piece on, then shares the look — which auto-publishes to the TF gallery and the designer's portfolio.
- Buys directly; if needed, starts a return with one form that goes straight to the designer.

Designer user flow

- All set-up is up front: pay the fixed fee, upload the design, set price and run size.
- Pairs with an influencer (manually or via Insense) and pays them a promo fee plus affiliate commission.
- Owns fulfilment and returns end-to-end — TerraFerra takes no inventory or production risk.

Influencer user flow

- Sourced through Insense or directly; agrees terms and receives a unique affiliate link for the drop.
- Promotes to their audience — every sale through the link is attributed and credited automatically.
- Paid by the designer: a promo fee plus commission on attributed sales (handled via Insense if used).

Screen mockups — the drop web page (mobile)

1 • Drop page

2 • Virtual try-on

3 • Share the look

4 • Checkout

Returns — the simplest possible flow

TerraFerra captures and routes the request — it does not process refunds or move stock. That keeps the platform light and the designer in control.

The mockup shows a mobile app screen for 'Start a return'. It features the 'terra ferra' logo at the top, followed by the title 'Start a return' and the order number 'Order #TF-1042'. Below this is a 'Reason' button, a text area for '[notes]', and a large orange 'Submit request' button. At the bottom, a note states: 'Goes straight to the designer, who handles the return.'

Returns screen

Build checklist — for development

BUILD

- Templated drop web page (mobile-first)
- VTO integration
- Share to branded look image
- Auto-add look to TF gallery + designer portfolio
- Checkout + affiliate attribution capture
- Returns request form + designer notification
- Designer onboarding + fixed-fee payment

INTEGRATE

- Insense — influencers, affiliate links, payouts
- VTO API — FASHN / Nova (provider-abstracted)
- Stripe — product checkout + designer fee
- Social share — native share / platform APIs
- Designer logistics — external, not integrated

DECIDE

- Insense vs manual sourcing for v1
- Which VTO API (quality vs cost per render)
- Auto-share: gallery/portfolio is server-side; personal social post is one-tap (no silent posting)
- Attribution source: Insense affiliate vs own link parameters
- Refunds owned by the designer; TF only initiates
